Zero-Knowledge SSH Connection Manager

Strategic Masterplan: CATerm 2.0 & Official Sync Cloud

Prepared for: Cecep Saeful Azhar (Founder & Architect)

Product: CATerm (Cecep Azhar + Terminal) & CATerm Sync Cloud

1. Brand Identity & Positioning

Name Philosophy: CATerm encapsulates the founder's initials (CA) alongside the standard Linux utility `cat` (streaming output) and `Term` (Terminal). It establishes immediate technical credibility.

Visual Branding:

- **Primary Color:** Dark Slate #0b0f19 (Matrix/Hacker aesthetic)
- **Accent Color:** Cyber Blue #58a6ff
- **Logo:** A minimalist terminal prompt >_ blending into a subtle, sleek cat silhouette or abstract geometric shield (symbolizing security).
- **Tone:** Pragmatic, authoritative, developer-centric, no-nonsense.

2. CATerm Sync Cloud: Monetization & Pricing

The core local desktop application remains **100% Free and Open Source (MIT)**. Monetization focuses on convenience, multi-device synchronization,

and team collaboration via an official managed cloud.

Subscription Model (B2C & B2B)

- **Trial/Entry: \$1** for the 1st Month (Lowering the barrier to entry, hook users into

the ecosystem).

- **Individual Pro: \$3** / month recurring (Affordable, impulse-buy SaaS tier for

freelance developers).

- **Team Expansion: +\$1** / month per additional seat/team member (Scales

automatically with agency growth).

End-to-End Encrypted (E2EE) Sync Architecture

The Sync Cloud operates as a *Zero-Knowledge Relay*.

- The local SQLite database (Vault) is symmetrically encrypted using AES-256-GCM via Argon2id Key Derivation.
- Sync payloads are heavily obfuscated blobs. The cloud **never** receives

the Master Password or Data Encryption Key (DEK).

- When a team member is added, Public-Key Cryptography (ECDH) is used to exchange vault access asynchronously without exposing secrets to the server.

3. Go-To-Market & Social Media Promotion

Open Source Publication Strategy:

- **GitHub Launch:** Publish the v2.0.1 rewrite repository under the MIT license. Ensure a beautiful `README.md` containing high-quality GIFs of the terminal in action.
- **Product Hunt:** Schedule a launch highlighting *"The Open Source, E2EE Alternative to Termius & SecureCRT."*
- **HackerNews (Show HN):** "Show HN: CATerm – A zero-knowledge SSH manager built in Rust/Wails." Focus on the security architecture (TOFU, local-first).
- **Reddit Communities:** Cross-post tutorials and architectural breakdowns to `r/devops`, `r/selfhosted`, `r/linux`, and `r/sysadmin`.

Marketing Narrative: "Stop trusting your production SSH keys to proprietary cloud syncs. Own your vault locally. Sync securely."

4. Roadmap to v2.0.1 (Next Steps)

- **Step 1 (Today):** Complete documentation, logo generation, and final polish for v1.2 GA on GitHub.
- **Step 2:** Tag and push `v2.0.1` to GitHub as the foundational release preparing for the Cloud API bindings.
- **Step 3:** Build the Golang/Rust Cloud Sync API backend (to be hosted on FathCloud/Coolify).
